

Project Design Phase

Solution Architecture

Date	26 june 2026
Team ID	
Project Name	Darshan Ease
Maximum Marks	4 Marks

Solution Architecture:

The Darshan Ease solution architecture bridges the gap between the challenges faced by devotees and temple authorities by providing a secure, scalable, and user-friendly web application for online darshan ticket booking. The architecture integrates modern web technologies to automate the booking process, improve operational efficiency, and enhance the overall user experience.

The proposed solution consists of the following components:

1. User Interface (Frontend)

The frontend is developed using React.js, providing an intuitive and responsive interface for devotees, organizers, and administrators. Users can register, log in, browse temples, check slot availability, book tickets, and manage their profiles.

2. Application Server (Backend)

The backend is built using Node.js and Express.js, which process user requests, implement business logic, authenticate users, manage bookings, and communicate with the database through RESTful APIs.

3. Database Layer

MongoDB is used as the database to securely store user information, temple details, darshan slots, booking records, payment details, and organizer information. It ensures efficient data retrieval and management.

4. Authentication Module

A secure authentication system verifies user credentials and provides role-based access for Users, Organizers, and Administrators, ensuring data privacy and system security.

5. Booking & Slot Management Module

This module manages real-time darshan slot availability, ticket booking, booking confirmations, cancellations, and booking history, ensuring smooth and efficient slot allocation.

6. Payment Integration

A secure online payment gateway enables devotees to make ticket payments and optional donations safely while generating instant booking confirmations.

7. Admin & Organizer Dashboard

Dedicated dashboards allow organizers to manage temples, darshan slots, and bookings, while administrators oversee users, organizers, reports, and overall system management.
